Highly complex forms can be implemented with vectogramm® routing technology

RESOPAL® MASSIV The strong material

RESOPAL® Massiv is a solid RESOPAL® board with a thickness of up to 42 mm and with incomparable strength and durability. As a self-supporting, distortion-resistant board it has the same decor on both sides and requires no additional edge protection. If RESOPAL® Massiv is used as coating for substrate materials, thinner boards with a thickness of 2 mm and 3 mm can be used, which only have the decor on the face side and are sanded on the back side.

The use of corresponding core paper makes the edge neutral black. A striped edge is created by inlaying colored papers (called Color in RESOPAL®), which makes for an even thinner and more elegant effect.

VECTOGRAMM® IN RESOPAL® The dynamic surface

vectogramm® routing technology makes it possible to machine digitally controlled complex patterns through the colored top layer into the dark core of RESOPAL®. The additional depth of the line creates additional dimensions, of material properties and quality but especially of movement.

vectogramm® is a patented process and registered trademark of the P+P Holzbau GmbH.
